

Royalty Intelligence Platform

Architecture Overview — Summary Edition V2

Any royalty files in. One trusted royalty picture out.

A web platform that takes IPRS royalty statements and streaming-platform reports — with or without a song list, and with or without an earlier output — checks every file against its own totals, connects each song across the sources, and produces one master royalty matrix plus clear lists of what needs attention.

DOCUMENT	Architecture summary, derived from the full V3 architecture
VERSION	Summary Edition V2 — replaces Summary Edition V1 (which was derived from V2)
AUDIENCE	Partners, stakeholders and reviewers — no technical background needed
DATE	September 2026
CLASSIFICATION	Shareable overview — describes what the platform does, not how it is coded

SECTION 01 · OVERVIEW

What the platform is

Music rights holders earn royalties from many directions. The Indian Performing Right Society (IPRS) pays them for use of their songs on YouTube, Facebook and Instagram, Spotify, Apple Music, radio, television and through partner societies abroad. Distributors separately report what each recording earned on streaming platforms such as Spotify. Every source arrives in its own format and names songs in its own way.

The platform brings all of this into one web application. SVF Entertainment is its first client, but nothing in it depends on SVF: files for other rights holders and from other distributors are recognised and kept apart. Every output uses one proven layout — the layout of SVF's master sheet, **SVF-RD-SKV8**.

4

kinds of input — statements, platform reports, song list, earlier output

Optional

song list and earlier output — statements alone are enough

2

kinds of money, shown side by side and never added

2 people

for every change that moves money: one makes it, another approves

Why this is hard

A song is identified in three ways: by its title, by the **work number** IPRS pays against (the composition), and by the **ISRC** platforms report against (one recording). One composition can have many recordings — remixes, covers, male and female versions. No single source carries all three, and titles are spelt differently everywhere.

Source	Song title	Work number	ISRC	Always present?
IPRS royalty statements	✓	✓	—	Usually the main input
Platform revenue and usage reports	✓	—	✓	Sometimes
Song list (any layout)	✓	✓	✓	Sometimes
Earlier output from this platform	✓	✓	✓	Sometimes

Connecting these reliably — without ever attaching money to the wrong song — is the central problem. The platform links songs automatically only on exact codes, checks those links, and leaves every title-based match to a person.

Scope

In scope	Out of scope
Consolidating, checking and analysing royalty statements, platform reports, song lists and earlier outputs, for one or more rights holders; producing reviewable, versioned reports.	Making payments · contracts and splits · licensing · sending data back to IPRS or to distributors (correction lists can be exported for people to send).

SECTION 02 · INPUTS

Any mix of inputs, one output layout

Files play one of two parts. **Sources** bring new money. A **base** — a song list, an earlier output, or both — supplies the rows the new money is matched into. With no base, the platform builds the rows from the sources themselves.

FIGURE 1

Inputs, the platform, and what comes out

SOURCES — NEW MONEY

Royalty statements

IPRS payouts, by work number
any rights holder

Platform reports

revenue or plays, by ISRC
any distributor

BASE — OPTIONAL

Song list

titles, work numbers, ISRCs
any layout

Earlier output

a master sheet exported before
e.g. SVF-RD-SKV8

The platform

- 1 check every file
- 2 link songs by code
- 3 hold anything doubtful
- 4 people decide the rest
- 5 publish a new version

OUTPUTS

Master royalty matrix

SKV8 layout, next generation

Paid but not in the base

Same name, different code

Mismatches and held money

Statement register

Change log and cover sheet

What you get for each mix

You provide	You get
IPRS statements only	One row per composition (work number), every payout as its own columns. The most common case.
Statements + a song list	One row per song on the list, plus rows for anything paid that the list does not have — and flags where a paid song has the same name but a different ISRC or work number.
An earlier output + a new statement or platform report	The earlier rows kept, the new money added into them, new songs added at the end — and a separate list of everything the new file paid that the earlier output did not have.
Platform reports only	One row per recording (ISRC). Remixes and versions usually get nearby ISRCs; the platform flags them as "possible versions" but never joins them on its own.
Files for several rights holders	Each file's rights holder is read from the file. Only the chosen holders count; others are set aside and named on the cover sheet. With several holders, each one's money stays on its own rows.

SECTION 03 · DELIVERABLES

The questions it answers

Each deliverable answers one plain business question. All are available in the web workspace and as formatted Excel workbooks, and every workbook opens with a cover sheet that says exactly which files, decisions and rules produced it.

The question	What the platform provides
"What has every song earned, from every source?"	Master royalty matrix in the SKV8 layout — one row per listed song (per composition when there is no list), each payout side by side, totals by Indian financial year. Royalty from IPRS and gross revenue from platforms sit in separate columns and are never added.
"What was paid that is not in my list — or not in my last output?"	Paid-but-not-in-base list — a short hand-off list (ISRC, song name, work number) plus a full revenue workbook, with the money at stake for each song.
"Which songs have the same name but a different code?"	Same name, different code — every case where a paid song matches a listed title but carries a different ISRC or work number, with the evidence, a suggested answer and the decision taken.
"Where do the sources disagree?"	Mismatch report — conflicting titles or codes, sorted into real differences and harmless spelling or version variants. Each item keeps its status (new, acknowledged, sent for correction, fixed) from run to run.
"What money is waiting for a decision?"	Held-money report — every amount the platform would not place on its own, with the reason. Held money is always counted in the totals.
"What did each statement pay, and was it used?"	Statement register — every file with its rights holder, source, period, total, check result, and whether it was included, excluded or replaced.
"What changed since my last output?"	Change log — every song whose figures changed, before and after.
"How do compositions and recordings connect?"	Works view — one row per composition with its recordings listed under it, so nobody mistakes one row for one song.

SECTION 04 · END-TO-END FLOW

How it works

- 1 Collect.** Users upload any files. Each is checked for what it really is, scanned, and stored exactly as received. Repeat uploads are recognised.
- 2 Recognise.** Each file's kind, layout, rights holder or distributor, source and period are read from its name and content; anything missing is confirmed by a person at upload. A file whose layout has changed even slightly is set aside.
- 3 Check.** Every statement must agree with its own printed totals. A file that fails is left out and named on every report; the others carry on.
- 4 Link.** Songs are joined across sources by exact codes. Doubtful links are held; title-only matches become suggestions.
- 5 Decide.** An analyst reviews suggestions and held money; a second person approves anything that moves money.
- 6 Publish and deliver.** A new, read-only version is published and exported. Earlier versions are never changed.

FIGURE 2

End-to-end processing flow

Red boxes: exceptions set aside for a person. Amber: human decisions, which feed the next version.

SECTION 05 · CONNECTING SONGS

Compositions, recordings, and the links between them

The platform keeps two things apart. A **composition** is the song as written; IPRS pays against its work number. A **recording** is one recorded version; platforms pay against its ISRC. One composition can have many recordings, and occasionally one recording (a medley) belongs to several compositions. The links between them come only from a song list, an earlier output, or a person's approved decision — never from a title alone.

FIGURE 3

Where each kind of money lands

The linking rules, in plain words

Codes link automatically

The same work number, or the same ISRC, is the same thing. These links are made without waiting for a person — and then checked.

Titles only suggest

A matching title creates a suggestion with its evidence and a score. It moves no money until an analyst accepts it and a second person approves.

Doubtful links are held

The money waits for a person when the file is for another rights holder, one code points to two different songs, the titles are completely different, or a song suddenly earns far more than usual. Held money still counts in every total.

People have the last word

If an analyst says two entries are different, no later upload can join them. The platform raises a conflict instead and holds the money.

Without a song list or an earlier output, rows are simply one per composition (from IPRS) and one per recording (from platforms); the platform suggests where a composition and a recording look like the same song.

SECTION 06 · HOW THE PARTS FIT TOGETHER

System architecture

The platform is a conventional web application split into separate **zones**. Each zone can do only its own job, so a problem in one cannot quietly change another. Uploaded files are opened in a sealed area; results live in one place; the record of who changed what lives in another that nobody can edit.

FIGURE 4

Zones and what each is allowed to do

Across all zones: company sign-in only (a leaver's access ends when their company account is disabled) · keys held in a secrets manager · everything encrypted · all data kept in India · backups in a separate account, with a restore test every quarter.

SECTION 07 · WHAT USERS SEE

The workspace

The workspace is a set of tabs in the order the work is done, from bringing files in to taking reports out.

Files

Drag and drop anything. Each file shows what it was recognised as, whose it is, its period, and whether its layout matched exactly.

Master

The full royalty matrix. Search, filter, and open any song to see every payment, the file and line it came from, and how it was linked.

New run

Pick the rights holder, add a song list or an earlier output if there is one, pick the new files — and see what the output will contain.

Findings

Paid but not in the base, same name with a different code, and mismatches — each with its status and history.

Validation

Every statement's totals beside its printed totals, pass or fail. Files left out, and the money they hold, are listed.

Approvals

The second person's queue: decisions that move money, final versions, and rule changes waiting for sign-off.

Review

Held money, title suggestions ranked by strength, and conflicts with earlier decisions — accept, reject, or mark as different.

Exports

Every workbook of every version, ready to download, with its history kept.

Who can do what

Role	Can do	Cannot do
Viewer	See published versions; download reports	Upload anything or change results
Analyst	Add song lists and earlier outputs; run and review; propose decisions	Approve their own decisions
Data operator	Upload statements and platform reports; map new file layouts	Approve their own mappings
Approver	Approve money-moving decisions, final versions and rule changes	Approve anything they made
Administrator	Manage users, rights holders and settings	Approve money-moving decisions

Permissions are enforced by the platform itself on every request, not just hidden on screen.

SECTION 08 · DESIGN PRINCIPLES

Built to be trusted

Every rupee accounted for

Each statement must agree with its own printed totals. A file that fails is left out and named — never forced in. Held money is always counted. Combined totals are re-checked on every version.

Codes link, people decide

Exact codes link automatically and are checked. A title never moves money without a person's approved decision.

Two kinds of money, never mixed

IPRS royalty (the rights holder's share) and platform gross revenue sit side by side and are never added into one figure.

Nothing is overwritten

Every published version is read-only. Corrections create a new version; earlier ones can always be opened.

Every figure explainable

Any number traces back to the file and line it came from, and every link shows how it was made and who approved it.

Reproducible, rules included

Matching settings, file layouts and money rules are numbered and versioned. The same files, decisions and rule version always give the same report.

SECTION 09 · VERSIONS AND DECISIONS

FIGURE 5

A version is fixed by five things

Undoing a decision makes a **new** version without it — "as if it never happened".

Later decisions that depended on it are listed for a person to review first.

Earlier versions are never changed.

About this document. This is Summary Edition V2, prepared for general sharing and derived from the full V3 architecture. It explains what the platform does and how its parts fit together. File formats, matching rules, the data model and processing logic are specified in the full architecture and are intentionally not included here.

SECTION 10 · MEASURING QUALITY

Is the answer right?

Checks that a file adds up prove the process ran; they do not prove the answer is right. So every version also reports how accurate its matching was. Starting figures, measured on SVF's files:

Measure	Starting figure
Songs listed as "missing" that the client confirmed as truly missing	41 of 93 (44%)
Songs listed as "missing" that turned out not to be the client's	34 of 93
Rows that got some platform money through a title match in the old process	81 rows
Recordings listed under more than one composition	263
Uploaded statements belonging to another rights holder	1 of 46
Royalty with no stated usage period	₹29,275.34
Suggestions accepted, and decisions later reversed	measured from the first review

SECTION 11 · TERMS USED

Glossary

Term	Meaning
IPRS	Indian Performing Right Society — the collecting society that pays royalties to its members.
Rights holder	The member a statement pays — a publisher, composer or author. SVF is one.
Distributor	The company that sends a client its streaming-platform reports.
Statement	One IPRS royalty file: one payout run, one source, one rights holder.
Work number	IPRS's number for a composition; royalties are paid against it.
ISRC	International Standard Recording Code — identifies one recording; platforms report against it.
Song list	A client's own list of its songs, with work numbers and ISRCs. Optional.
Earlier output	A master sheet the platform exported before, uploaded again so new money can be added to it.
Base	The rows new money is matched into: a song list, an earlier output, or both.
Held money	Money the platform would not place on its own; it waits for a person and is still counted.
Version	A complete, read-only set of results. Corrections always create a new version.
SKV8 layout	The format of SVF's master sheet SVF-RD-SKV8, used for every client's output.
