

Royalty Intelligence Platform

Architecture Overview — Summary Edition

One trusted view of every royalty, from every source.

A web platform that consolidates IPRS royalty statements, SVF's song catalogue and streaming-platform reports; reconciles every figure to its source; and shows which songs are earning, which are missing from the catalogue, and where the sources disagree.

DOCUMENT	Architecture summary, derived from the full V2 architecture
AUDIENCE	Partners, stakeholders and reviewers — no technical background needed
DATE	September 2026
CLASSIFICATION	Shareable overview — describes what the platform does, not how it is built

SECTION 01 · OVERVIEW

What the platform is

SVF Entertainment earns music-publishing royalties from many directions. The Indian Performing Right Society (IPRS) distributes money collected from streaming services, video platforms, social media, radio, television and partner societies abroad, while platforms such as Spotify separately report what SVF’s recordings earned on their service. Each source arrives in its own format, on its own schedule, and describes songs in its own way.

The **Royalty Intelligence Platform** brings all of this together in one web application. It takes in every statement and report, checks each one against its own printed totals, connects every song across the sources, and presents a single, trustworthy picture of what each song has earned — together with the gaps, duplicates and disagreements that need someone’s attention.

6 input formats recognised automatically	10+ revenue sources — digital, broadcast and overseas	100% of statement totals reconciled before use	0 songs merged without an analyst’s approval
---	--	---	---

Why this is hard

A song can be identified in three ways — by its **title**, by the **work number** IPRS pays against, and by the **recording code (ISRC)** platforms report against. No single source carries all three, and titles are spelt differently from one source to the next.

Source	Song title	Work number	Recording code
SVF song catalogue	✓	✓	✓
IPRS royalty statements	✓	✓	—
Platform revenue reports	✓	—	✓
Platform usage reports	✓	—	✓

Connecting these sources reliably — without ever attaching money to the wrong song — is the central problem the platform solves.

Scope

In scope	Out of scope
Consolidating, reconciling and analysing royalty statements, the song catalogue, platform reports and any user-supplied song list; producing reviewable reports.	Making payments · administering contracts and splits · licensing · sending data back to IPRS.

SECTION 02 · DELIVERABLES

The questions it answers

Each deliverable is built around a plain business question. All of them are available in the web workspace and as formatted Excel workbooks.

The question	What the platform provides
"What has every song earned, from every source?"	Master Royalty Matrix (current edition: SVF-RD-SKV8) — one row per song, with each distribution shown side by side and totals by Indian financial year.
"Which songs are earning but missing from my song list?"	Coverage Audit — runs against any song sheet the user uploads and any mix of revenue sources, and states the revenue at stake for each song found.
"Which entries are really the same song under different codes?"	Same-Song Review — likely duplicates are proposed; an analyst confirms or rejects each one; confirmed merges never change a total.
"Where do my list, IPRS and the platforms disagree?"	Identity Mismatch Report — conflicting titles, work numbers or recording codes, with the revenue attached to each.
"What did each statement pay in total?"	Statement Register — every distribution with its revenue source, period and total.

SECTION 03 · END-TO-END FLOW

How it works

1 Collect

Users upload royalty statements, the song catalogue, platform reports or any song sheet. Repeat uploads are recognised; unfamiliar formats are set aside for review rather than guessed at.

2 Prepare

Each file is recognised and classified by revenue source and period, and its royalty lines are captured. A file moves forward only when its figures agree with its own printed total.

3 Unify

Songs are connected across all sources into one register. Every connection records how it was made, so it can always be explained.

4 Analyse

Four engines produce the master matrix, the coverage audit, the mismatch report and the same-song proposals.

5 Decide

An analyst reviews the proposals. Approved decisions produce a new version of the register — earlier versions are never edited.

6 Deliver

Results are explored in the web workspace and exported as formatted, reproducible Excel reports.

Figure 1 on the next page shows the same flow as a diagram.

FIGURE 1

End-to-end processing flow

Dashed amber path: an analyst's approved decisions feed back into the register as a new version. Red boxes: exceptions held for a person to resolve.

SECTION 04 · HOW THE PARTS FIT TOGETHER

System architecture

The platform follows a conventional, layered web-application design. People work in a browser; requests pass through a secure gateway to the application services; heavy processing runs in the background so the workspace stays responsive; and all data is kept in a structured database and a secure file store.

FIGURE 2

Layer responsibilities

Layer	Responsibility
Users & roles	Three roles with different permissions. Only analysts and administrators can record decisions that change results.
Presentation	A browser-based workspace — nothing to install. Large tables stay fast even with thousands of songs and hundreds of columns.
Application services	Receive files, assemble and verify the register, run the audits and reviews, and produce reports.
Background processing	Long-running work is queued and processed in parallel. A failed file never stops the rest of the batch.
Data & storage	Structured records, original files and a full decision log. Original uploads are always kept; reports can be regenerated at any time.

SECTION 05 · WHAT USERS SEE

The workspace

The web workspace is organised as a set of tabs that follow the natural order of work, from bringing files in to taking reports out.

Upload Drag-and-drop files and see what each one was recognised as — revenue source, period and society — with the option to correct it.	Validation Every statement’s captured total beside its printed total, marked pass or fail. Nothing proceeds while a failure is unresolved.
My Sheets Any song list the user brings, in any layout. Its columns are mapped once and recognised automatically next time.	Master Viewer The full royalty matrix: search, filter, and open any song to see every payment behind it and where it came from.
Coverage Audit Pick a sheet, pick the revenue sources, press run — and see every earning song that is missing, with the revenue at stake.	Merge Review A queue of likely same-song groups, strongest first. Merge, mark as different, or undo a past decision.
Mismatch Report Conflicts between sources, grouped by type, with the revenue involved.	Exports Generate and download every report; the history of each version is kept.

SECTION 06 · DESIGN PRINCIPLES

Built to be trusted

Every rupee accounted for Each statement must agree with its own printed total before it counts, combined totals are re-checked on every run, and merges never change a total.	People decide the grey areas The platform proposes; it never decides on its own that two entries are the same song.
Nothing is overwritten Every result set is a read-only version linked to the one before it, and any decision can be undone.	Every figure explainable Any number can be traced back to the file it came from, and every match shows how it was made.
Reproducible The same inputs and decisions always produce identical reports.	Ready to grow New revenue sources, societies, financial years and sheet layouts are added through configuration, not rebuilding.

SECTION 07 · LINEAGE

Versions and decisions

Results are never edited in place. When an analyst approves a set of decisions, the platform produces a new version and keeps the previous one untouched. This gives a complete history of how every report came to be, and makes any decision safe to reverse.

FIGURE 3

SECTION 08 · TERMS USED

Glossary

Term	Meaning
IPRS	Indian Performing Right Society — the collecting society that distributes royalties to its members.
Statement	One royalty file from IPRS, covering one payout run for one revenue source.
Distribution	A single payout run, identified by its own distribution number.
Work number	IPRS’s identifier for a musical composition; royalties are paid against it.
ISRC	International Standard Recording Code — identifies a specific recording; platforms report revenue against it.
Catalogue	SVF’s own list of its songs, their work numbers and recording codes.
Coverage audit	The check for songs that earn money but are missing from a given song list.
Version	A complete, read-only set of results. Corrections always create a new version.

About this document. This is a summary of the platform’s architecture, prepared for general sharing. It explains what the platform does and how its major parts fit together. Detailed specifications — file formats, matching rules, the data model and processing logic — are maintained separately and are intentionally not included.
